

GUIDE

1993-1994

TO EATING ONTARIO SPORT FISH

Please note that at certain locations, consumption advice may be given for some species, or species at lengths which are not legal to possess under the Ontario Fishery Regulations. Anglers should check the "1993 Ontario Sport Fishing Regulations (Summary)" to ensure that the particular waterbody is open to fishing or that all fish which are kept are legal to possess. These publications are available from: the Ministry of Natural Resources, Natural Resources Information Centre (MacDonald Block, room M1-73, 900 Bay St., Toronto, Ontario, M7A 2C1), the local office of the Ministry of Natural Resources, and from fishing licence issuers.

Consumption guidelines for fish caught by anglers

Consumption Frequency					
Long-term consumption	No restrictions	0.2 kg/wk (0.5 lb./wk.)	0.1 kg/wk. (0.3 lb./wk.)	1 or 2 meals per month 0.5 kg/mo. (1 lb./mo.)	None
One-week vacation	No restrictions	10 meals 2.3 kg (5 lb.)	7 meals 1.5 kg (3 lb.)	1 or 2 meals 0.5 kg (1 lb.)	None
Two-week vacation	No restrictions	5 meals per wk. 1.3 kg/wk (2.8 lb./wk.)	4 meals per wk 0.8 kg/wk. (1.9 lb./wk.)	1 or 2 meals /wk 0.5 kg/wk (1 lb./wk.)	None
Three-week vacation	No restrictions	4 meals per wk. 1 kg/wk (2.1 lb./wk.)	3 meals per wk. 0.6 kg/wk (1.4 lb./wk.)	1 or 2 meals /wk 0.5 kg/wk (1 lb./wk.)	None

Children under 15 and women of childbearing age should eat only fish in  category.

Contaminants analysed

The number identifies the contaminant or group of contaminants for which the fish was tested:

- 1 Mercury
- 2 Mercury, PCBs, mirex and pesticides
- 3 PCBs, mirex and pesticides
- 4 Mercury, PCBs and mirex
- 5 Mercury, other metals, PCBs, mirex and pesticides
- 6 Mercury, other metals
- 7 Dioxins and furans
- 8 Mercury, PCB's, mirex, pesticides, chlorinated phenols and chlorinated benzenes
- 9 Polynuclear aromatic hydrocarbons (PAH's)

Consumption guidelines	Inside cover

Preface

This 17th edition of the *Guide to Eating Ontario Sport Fish* gives consumption advice for sport and game fish found at more than 1,600 locations in the province.

As most of the consumption recommendations remain the same from one year to the next, and to keep costs to a minimum, the next issue of the guide will be published in 1995, and every two years after.

We suggest that you keep this guide for use during the 1993 and 1994 fishing season.

The 1993 *Guide to Eating Ontario Sport Fish* is the work of scientists and technicians with the Ministries of Environment and Energy and Natural Resources.

Staff at the Ministry of Natural Resources collect the fish and send them to the Ministry of Environment and Energy laboratories where they are analyzed for a variety of substances, including mercury, PCBs, mirex and DDT. The results are used to develop the tables published in this guide which give size-specific consumption advice for each species tested from each location. The consumption advice is based on federal government health protection guidelines.

Fish collection and testing is a continuing program. Available resources are balanced between testing new lakes and rivers and retesting those locations where changes in contaminant levels may be occurring. By testing the same fish species at the same location over a period of many years, scientists can determine trends in the levels of certain contaminants in those species. In some cases the data can be used to pinpoint sources of pollution so that action can be taken to control these discharges.

To report occurrences of pollution or fish kills, contact the nearest office of the Ministry of Environment and Energy listed on page 166 of this book.

Anyone requiring information on angling regulations, limits of catch or open seasons should obtain a copy of the publication *Ontario Sport Fishing Regulations*. This is available from any office of the Ministry of Natural Resources listed on page 166.

To obtain detailed data for a specific location tested under the sport fish contaminant monitoring program or further information on the results in this and previous guides, contact:

Key to using the guide tables

The guide tables provide sport fish consumption advice based on the level of contaminants found in fish according to their species, length and location.

Please note that laboratory analyses are carried out on the lean, dorsal, skinless, boneless muscle tissue of the fish and the consumption guidelines are based on the results from this portion. Other parts of the fish - the whole fish, fish steaks or belly fat - may contain higher concentrations of organic contaminants such as PCB's, mirex, DDT or 2,3,7,8 - TCDD as these

contaminants are attracted to fatty tissue. It is therefore recommended that only skinless, boneless fillets of these fish be consumed.

The water body names and locations were obtained from the Gazetteer of Canada (Ontario). The location description includes latitude and longitude, enabling anglers to refer to the Ontario Official Road Map (which is marked accordingly) to determine the general location of the body of water. Larger scale topographical maps can then be used if necessary to pinpoint the exact location. An alphabetical listing of all locations tested is contained in the index.

The following is a key to the various components of the tables, using a simulated example called Deep Lake.

		Northern Ontario/Nord de l'Ontario		137								
		Fish size in centimetres (inches) Longueur du poisson en centimètres (pouces)										
		15-20 (6-8)	20-25 (8-10)	25-30 (10-12)	30-35 (12-14)	35-45 (14-18)	45-55 (18-22)	55-65 (22-26)	65-75 (26-30)	>75 >(30)		
Water Body/ Cours d'eau		Fish Species/ Espèces de poisson										
Deep Lake Lac Deep		Walleye ¹ Doré ¹										
4550/8035 Trout Twp./Canton de Truite		Lake Trout ² Truite de lac ²										
Cochrane Dist./Dist. de Cochrane												

Location identifiers

- The tables are divided into three sections by region: Southern Ontario, Northern Ontario and the Great Lakes, as noted at the top of each page.
- The name of the location sampled
- The latitude and longitude of the location
- The township, county or territorial district of the location

Fish species tested

- The species tested are usually those species that are most likely to indicate elevated levels of contaminants (see the section entitled Selection of fish species for testing).

Fish length

- The total length of the fish is measured,

from the tip of the nose to the tip of the tail. The fish length is expressed in the tables in both centimetres and, in brackets, inches.

Contaminants analysed

- The number identifies the contaminant or group of contaminants for which the fish was tested:
- Mercury
- Mercury, PCBs, mirex and pesticides
- PCBs, mirex and pesticides
- Mercury, PCBs and mirex
- Mercury, other metals, PCBs, mirex and pesticides
- Mercury, other metals
- Dioxins and furans
- Mercury, PCB's, mirex, pesticides, chlorinated phenols and chlorinated benzenes
- Polynuclear aromatic hydrocarbons (PAH's)

The fact that fish were tested for a particular group of contaminants does not mean that the fish will contain all of these contaminants. For example, fish analysed for contaminant group 4 may contain only mercury and not PCBs or mirex.

In a number of locations, fish are analysed only for mercury as this is likely to be the only contaminant to cause consumption restrictions.

Fish consumption symbols

Unrestricted consumption

-  This is the only category of fish that is suitable for consumption by women of childbearing age (pregnant women, women intending to become pregnant or breastfeeding mothers) and children under 15. No substances tested were found at levels which would cause fish consumption to be restricted.

Restricted consumption

-  Consumption of these fish is restricted, based on mercury levels between 0.5 and 1.0 parts per million.
-  Consumption of these fish is further restricted, based on mercury levels between 1.0 and 1.5 parts per million.

-  Consumption of these fish is restricted, based on the presence of one or more industrial organic contaminants, such as PCBs or mirex, at levels above federal guidelines.

No consumption

-  None of these fish should be consumed, based on mercury levels above 1.5 parts per million.

Consumption guidelines

The table below presents the maximum recommended consumption of Ontario sport fish according to their contaminant content and frequency of consumption.

Many anglers in Ontario catch and consume fish throughout the year: these people are considered to be long-term consumers and should consult the long-term consumption category on the table below. However, some anglers only catch and consume fish on an annual fishing vacation: these people should select the appropriate one-week, two-week or three-week category.

The maximum consumption quantities are given in number of meals and total weight per week. A meal consists of 230 g (0.5 lb.). Please note that women of childbearing age and children under 15 should only eat fish in the  category.

Consumption guidelines for fish caught by anglers

Consumption Frequency					
Long-term consumption	No restrictions	0.2 kg/wk. (0.5 lb./wk.)	0.1 kg/wk. (0.3 lb./wk.)	1 or 2 meals per month 0.5 kg/mo. (1 lb./mo.)	None
One-week vacation	No restrictions	10 meals 2.3 kg (5 lb.)	7 meals 1.5 kg (3 lb.)	1 or 2 meals 0.5 kg (1 lb.)	None
Two-week vacation	No restrictions	5 meals per wk. 1.3 kg/wk. (2.8 lb./wk.)	4 meals per wk. 0.8 kg/wk. (1.9 lb./wk.)	1 or 2 meals /wk. 0.5 kg/wk. (1 lb./wk.)	None
Three-week vacation	No restrictions	4 meals per wk. 1 kg/wk. (2.1 lb./wk.)	3 meals per wk. 0.6 kg/wk. (1.4 lb./wk.)	1 or 2 meals /wk. 0.5 kg/wk. (1 lb./wk.)	None

Children under 15 and women of childbearing age should eat only fish in  category.

Example:

An angler on a three-week fishing vacation catches a 40-cm (16-inch) walleye from Deep Lake and wants to determine the suitability of that fish for consumption.

The angler should:

- Find Deep Lake in the guide tables:

Fish Species/ Espèces de poisson	15-20 (6-8)	20-25 (8-10)	25-30 (10-12)	30-35 (12-14)	35-45 (14-18)	45-55 (18-22)	55-65 (22-26)	65-75 (26-30)	>75 (30+)
Walleye Doré									

- Note that the symbol given for walleye in the 35- to 45-cm (14- to 18-in.) range is .
- As the symbol is not , the angler knows immediately that the fish is not suitable for consumption by women of childbearing age and children under 15.
- If the consumer is not a woman of childbearing age or a child under 15, consult the three-week per year category in the consumption guidelines table on the inside front cover. This shows that the recommended maximum consumption is four meals, or one kilogram, per week.

The sport fish contaminant monitoring program

Selection of locations for testing

With over 250,000 lakes, innumerable rivers and streams and many local areas in the Great Lakes, it would not be practical or economical to test fish from every water body.

A location may be selected for testing for one or more of the following reasons:

- It is a popular angling area.
- There is a known or suspected source of pollution nearby.
- It is a major source of food for local inhabitants (usually lakes in the vicinity of Native reserves).

- It is being opened for recreational development.
- It is part of a monitoring program for long-term studies of contaminants in fish.

The selection of testing sites is an ongoing process and public input is welcomed.

Selection of fish species for testing

Most lakes and rivers contain a variety of fish species. When selecting appropriate species for contaminant testing, the fact that not all species accumulate a particular contaminant at the same rate has to be taken into account.

Therefore, one kind of fish of a certain size may have a much lower contaminant concentration than another species of the same size. This is due to the fact that different fish feed on different things, prefer different habitats, grow at different rates and are physiologically different.

For example, walleye (yellow pickerel) and northern pike are likely to contain higher levels of mercury than whitefish of the same size since walleye and pike are top predators, feeding on smaller fish which may also contain elevated mercury levels.

Whitefish, on the other hand, feed lower down in the food chain, on aquatic insects and invertebrates which contain less mercury than do small fish.

Therefore, when testing fish for mercury in a specific area, the practice is initially to select those species which are top predators, as they will indicate the highest mercury levels likely to be found. If low levels of mercury are found in predators, the testing of other species may not be necessary.

In testing for organic contaminants such as PCBs and mirex, species with high fat levels, such as salmon, lake trout, smelt and perch, are selected since organic chemicals usually tend to accumulate in fatty tissue.

Again, if these species do not contain excessive levels of organic contaminants, then less fatty species from the same location may not have to be tested.

Collection of fish for testing

The fish are collected by Ministry of Natural Resources staff using various netting methods. Whenever possible, the selection includes 20 fish of each species with lengths and weights representative of the size range of that species in the locations being tested. The length, weight and sex of each fish collected are recorded. A boneless, skinless fillet of dorsal muscle flesh is removed from the fish (see illustration), packaged and frozen for shipment to Ministry of Environment and Energy laboratories in Toronto or Thunder Bay.

Retesting of locations

Since the mid-1970s the sport fish contaminant monitoring program has added, on average, 100 new locations each year, bringing the total number of sites tested to over 1600.

As well as adding new locations, the program incorporates into its schedule the retesting of lakes and rivers where this is warranted. In areas remote from human activity, where fish are relatively unaffected by pollution, any consumption restrictions are usually limited to elevated mercury levels in the larger and older predatory species such as walleye and northern pike. The source of mercury in

these areas is largely natural and does not change much over time; therefore, concentrations in fish do not change substantially.

However, in areas affected by human sources of pollution, the number of possible contaminants may be much larger and the levels found in fish can be significantly affected by changes in the levels of pollution.

Retesting locations are divided into three general groups:

- Areas where contaminant levels for one or more pollutants are either unusually elevated or change substantially. These locations are retested every one to three years, depending on their angling popularity or whether they are a major food source for local inhabitants.
- Areas which show no signs of substantial changes in contaminant levels but which are very popular angling areas. These locations are retested at least every 5 years.
- All other areas - usually relatively remote locations with no major sources of pollution nearby and no indication of changing contaminant levels in fish. These locations are retested as available resources permit, approximately every 10 years.

Testing of fish

A boneless, skinless dorsal fillet sample not only provides the most consistent test results, but is also the best edible portion of most sport fish.

The fish tissue is analysed for contaminants at the Ministry of Environment and Energy's laboratories using a variety of methods depending on the particular contaminant.

Preserving and preparing your fish for cooking

If you decide to keep and eat your catch, you should keep it in the best possible condition until it reaches the table. Freshly caught fish should be chilled on ice or in a refrigerator as soon as possible to avoid spoilage. Then, at the earliest opportunity; the fish should be cleaned, dressed and refrigerated or preserved for future use.

The following is one of the procedures commonly used for gutting, filleting and skinning fish:

- Slit open the belly from the vent (anal opening) forward to the head and remove the internal organs.
- Trim away the head and fins.
- Lay the fish on its side on a cutting board. With a thin sharp knife, cut through the skin and flesh just behind the head down to the backbone. Turn the knife blade along the backbone and, with a sawing motion of the blade, follow the backbone down to the tail, keeping as close to the backbone as possible.
- Repeat for the fillet on the other side of the fish.
- Laying each fillet skin-side down on the board, remove the rib bones by inserting the knife blade just under the ribs and separating them from the fillet with as little flesh left on them as possible. Trim away the pelvic fin and any belly fat from the ventral portion of the fillet.
- Lay the fillets skin-side down and, starting at the tail with the knife blade parallel to the skin and as close to it as possible, slice forward with a sawing motion to separate the skin from the fillet. You are then left with skinless, boneless fillets. Wash in clean cold water and cook, refrigerate, freeze or preserve as desired.

How to release fish

A number of anglers fish for the "thrill of the catch", and release their fish to allow

them to be caught again. If you decide not to keep a particular fish, here are some tips to apply to safely return the fish to the water:

1. Time is essential, so quickly play and release the fish. A fish played for too long will be too exhausted to recover. A fish hooked in deep water should be brought up slowly to prevent stress due to pressure and temperature changes.
2. Keep the fish in the water as much as possible, since fish out of water will suffocate. Do not allow the fish to flop on the ground or on the rocks. Just a few inches of water under a thrashing fish will act as a protective cushion.
3. Gentle handling of the fish is essential, and hands should be kept wet at all times while handling any fish. Do not put your fingers in the gills or in the eye sockets. Small fish should not be squeezed but should only be lifted by the lower lip. A net is helpful while handling fish, but keep it in the water.
4. Remove hooks quickly using longnosed pliers. If the fish is deeply hooked, cut the line and leave the hook in, as it will dissolve and will not harm the fish. Do not try to tear out hooks.
5. To revive an unconscious fish, hold it upright in the water heading upstream (if there is a current). Apply artificial respiration by moving the fish forward and backward so that water runs through the gills. It may take a few minutes for the fish to revive. When the fish does begin to struggle, release it.

Fish Parasites

Anglers sometimes catch fish which contain worms, grubs, cysts or nodules in the flesh. When cleaning fish, anglers may notice worms in or around the intestines of the fish or fungus growths on the skin, fins or gills. These parasites are a normal part of the ecosystem in which the fish lives. While not esthetically pleasing, the edible portions containing parasites,

if properly and thoroughly cooked, do not present a health hazard.

Some of the most commonly seen parasites associated with fish are black spot in bass and yellow perch, yellow grubs, leeches, lamprey, fish lice and gill flukes.

Tumors in fish

Occasionally, anglers catch fish with external growths, tumors, sores or other lesions. Such abnormalities generally result from viral or bacterial infections. Abnormalities in the liver or intestine are sometimes seen in coarse fish such as white suckers and brown bullheads, and can be caused by parasites or tumors. Concern about the potential effects of these diseases on the fish themselves and the possible role of pollution in causing tumors in some coarse fish has prompted ongoing investigations into these abnormalities. Growths on game fish caused by viruses include lymphocystis, dermal sarcoma and lymphosarcoma.

Lymphocystis, a viral disease affecting walleye and perch, is common throughout Canada. Viruses infect the fish's skin through contact with infected fish during the spring spawning run, forming pale or white cauliflower-like growths. Lymphocystis does not kill affected fish. Tagging studies have shown that these fish can lose the growths by the following spring.

Dermal sarcoma, another viral disease affecting walleye, is caused by viruses which infect cells and cause growths just under the skin. These growths can be removed by skinning the fish.

A recent study by the Ministry of Environment and Energy and the Ministry of Natural Resources has shown that walleye with external skin lesions such as lymphocystis and dermal sarcoma do not have higher contaminant levels than unaffected fish.

Lymphosarcoma is a viral disease affecting muskellunge and northern pike. This virus is transmitted at spawning, but the lesions caused by it can vary depending on the season and stage of the disease. In the spring, affected fish have thick white patches on their skin from which viruses are shed and these in turn infect other fish. Later in the year these patches may heal, forming blotchy red sores or even normal skin. The virus causing lymphosarcoma infects the white blood cells of the fish and can spread throughout the body during the summer or over several years. This disease can kill infected fish.

Coarse fish in various parts of the Great Lakes have been found to have lip and skin growths similar to human warts in appearance. Growths on coarse fish kept in the laboratory often disappear and new ones can develop very quickly, suggesting that viruses likely cause these tumors.

Studies on Canadian and American areas of the Great Lakes have found an increased rate of lip and skin growths on coarse fish captured in polluted areas; in some extremely polluted areas, liver and intestinal tumors have been found in these fish. Studies suggest that pollution may cause the liver tumors and may indirectly cause skin growths- warmer water often found in polluted areas attracts larger numbers of fish, thus increasing their risk of becoming infected with viruses. Considerable research, much of it being conducted or funded by the Ontario and Canadian governments, is being undertaken to determine whether pollution is a cause of these tumors.

While the appearance of viral or bacterial infections in fish is unsightly, there is no known health risk from consuming an infected fish that meets the consumption guidelines. However, caution is advised.

Contaminants in fish

There are many naturally occurring substances, such as mercury which, at levels normally found in air, water and food, pose no hazard to the environment or to human health. A number of synthetic substances, such as PCBs, mirex and dioxin, may also be found in the environment. When the level of these substances exceeds government guidelines or objectives, then these substances can be called contaminants or pollutants.

The following section describes the broad range of substances which may be tested for in Ontario sport fish. For more information on these substances and their health implications, please contact the office of the sport fish contaminant monitoring program. (see page 1)

Inorganic substances

Mercury

Mercury is a naturally occurring metal which is found in very low levels in air, water, rocks, soil and plant and animal matter.

At one time mercury was widely used in industry; however, government and industry took action in the late 1960s and early 1970s and mercury discharges from major industrial sources have been virtually eliminated.

Mercury is attracted to particles in the water and settles to the bottom sediments where it can be converted by micro-organisms into methylmercury. Methylmercury is rapidly absorbed by a fish, either directly from water passing over its gills or ingested with the organisms which form its diet. Since fish eliminate mercury at a very slow rate, concentrations of this substance gradually accumulate.

The consumption guidelines developed for use by Ontario anglers are based on federal guidelines supplemented by recommendations from the World Health Organization and supported by medical evidence gained through the study of methylmercury poisoning epidemics in Japan and Iraq.

Other metals

Copper, nickel, zinc, cadmium, manganese, chromium, arsenic and selenium are sometimes found in fish tissue but not at levels which would suggest a need for consumption restrictions.

Elevated levels of lead were detected in fish collected downstream from a tetraethyl lead manufacturing plant on the St. Lawrence River in 1983. Since this plant was shut down in 1985, lead levels have declined.

Industrial organic chemicals

Polychlorinated biphenyls (PCBs)

PCBs are a group of chlorinated organic compounds first commercially developed in the late 1920s. They are not formed naturally in the environment, so their presence can always be attributed to human activity.

PCBs tend to persist for years in the natural environment. This, coupled with the fact that they bioaccumulate readily in the aquatic ecosystem, has meant that top predator species of fish with a high fat content (for example, salmon and trout) have, in some Ontario waters, accumulated PCBs to contaminating levels. PCBs have been banned in all new products and are now only found as an insulating fluid in existing closed electrical power transformers and capacitors. Strict regulations for the storage and disposal of PCBs and PCB-contaminated equipment minimize the chance of further releases of PCBs into the environment and have

resulted in declining levels of PCBs in the aquatic environment. The consumption advice provided in this guide for sport fish containing PCBs is based on the federal guideline of 2.0 parts per million for the sale of commercial fish.

Mirex

Mirex is a chlorinated carbon compound used as a pesticide in the southern United States but never registered for such use in Canada.

Mirex has been detected in fish primarily from Lake Ontario. The sources were found to be a former processor of mirex in Niagara Falls, New York and a manufacturing plant in Oswego, New York. The behaviour of mirex in the aquatic environment is similar to that of PCBs in that it remains in the environment for a long time and has a high affinity for fats. The consumption advice provided in this guide for sport fish containing mirex is based on the federal guideline of 0.1 parts per million for the sale of commercial fish.

Pesticides

DDT

DDT, which was developed during the Second World War, gained widespread use as an insecticide for agricultural and public health purposes. DDT, like PCBs and mirex, is only slowly broken down in the natural environment.

However, levels of this substance in fish flesh have declined in the two decades since the use of DDT was severely restricted, and today there are no consumption restrictions due to DDT levels.

Toxaphene

Toxaphene is an insecticide that is extremely persistent in the aquatic environment. It was removed from general use in Canada in 1974 and restricted in the United States in 1982.

It is found occasionally in fish from Ontario waters, but concentrations are well below levels of concern.

Other pesticides

As part of the sport fish contaminant monitoring program, a number of pesticides used widely in the past throughout North America are routinely analysed. These substances are HCB (hexachlorobenzene) and the pesticides lindane, heptachlor, aldrin and chlordane. At sampling locations in Ontario they have not been detected at levels which would require any restrictions on the consumption of fish.

Dioxins and Furans

The Ministry of Environment and Energy has developed laboratory procedures which can now detect very low levels of the group of substances called dioxins and furans. Consumption advisories for dioxins and furans in this guide are based on a new Ontario sport fish guideline which has been adopted from Health and Welfare Canada criteria. The Ministry of Environment and Energy monitors 17 toxic forms of dioxins and furans in sport fish. The results for these 17 forms are multiplied by the equivalency factors to convert them into a number which represents the overall toxicity relative to the most toxic form of dioxin – 2,3,7,8 – TCDD. The new guideline for sport fish consumption is 15 parts per trillion toxicity equivalents of 2,3,7,8 – TCDD. The previous Ontario guideline was 20 parts per trillion for 2,3,7,8 – TCDD only. The more stringent guideline along with additional testing has resulted in new consumption advisories for several Great Lakes locations being issued in this guide.

New substances

The sport fish contaminant monitoring program tests for as many substances that may be of concern to the sport fish consumer as is practically possible. As methods become available to detect low levels of chemicals in fish, they are added to the battery of existing tests. The most recent additions to the list of contaminants tested by the program are: chlorinated phenols, chlorinated benzenes and polynuclear aromatic hydrocarbons (PAHs). Based on the results received to date, these substances are only found occasionally in fish, and at such low levels that would not affect consumption.

Trends in contaminant levels

The persistence of contaminants in the aquatic environment varies from substance to substance. The breakdown or transformation of contaminants into forms that are inactive or less toxic may take anywhere from minutes to years. As a result, for the more persistent substances, such as PCB, DDT and mirex, it may take many years of collecting and assessing data for trends to become clear. The data collected through the Sport Fish Contaminant Monitoring Program are particularly effective in detecting increases or decreases in contaminant levels over time.

One notable trend observed through the program is the general decline over time in the level of a contaminant in fish once the source of that contaminant has been curtailed or eliminated as a result of government actions. This type of trend has been found for contaminants such as PCBs, DDT and mercury.

Mercury has been found in fish everywhere in Ontario and mercury concentrations result in more consumption restrictions in sport fish than any other contaminant monitored by the program.

Major industrial sources of mercury such as from chlor-alkali plants and pulp and paper mills were virtually eliminated by the early

1970s. Relatively small amounts of mercury are still used in electrical and scientific equipment, and fungicides for golf courses. Mercury from other sources such as burning of fossil fuels can also enter the aquatic environment through precipitation.

In the late 1960s and early 1970s several water bodies in Ontario were contaminated with mercury from industrial discharges. Initially, mercury concentrations in fish from these locations were very high, but after government action halted mercury discharges, concentrations in fish have declined. In 1970, industrial discharges of mercury from a chlor-alkali plant in Sarnia into the St. Clair River contaminated downstream Lake St. Clair fish. Commercial fishing was halted and anglers were advised to "fish for fun" only and not to consume the fish. At the same time action was taken by the Province of Ontario to halt this industrial discharge of mercury. Since 1970, Lake St. Clair sport fish have been intensively monitored on an annual basis for a number of contaminants. Mercury is the only contaminant which causes any consumption restrictions. However, mercury levels in sport fish have declined dramatically so that many of the fish that are caught can now be consumed. Figure 1 shows the mean annual mercury concentrations for walleye from Lake St. Clair for 1970-1991.

A similar trend of decreasing mercury concentrations in fish was found in the English-Wabigoon River system, downstream of a chlor-alkali plant at Dryden. After control measures were taken, there was a marked decline in the concentration of mercury in walleye between 1970 and the early 1980s. However, the mean concentration in walleye appears to have levelled off. Figure 2 shows the mean annual mercury concentration in walleye from Clay Lake, which was the closest lake to the industrial source.

Several factors affect the mercury concentration in fish. Fish exposed to mercury for long periods tend to have higher mercury concentrations in their flesh. Consequently, older and larger fish have higher concentrations of mercury in their flesh. This is clearly demon-

strated in Figures 3 and 4 which show increasing mercury concentrations in fish flesh with increasing fish length.

Mercury concentrations in fish are influenced by other factors such as the contaminant level in the food they consume. Minnows and other small fish have higher mercury concentrations than aquatic insects and invertebrates. Consequently, species such as walleye and pike which feed on other fish tend to have higher mercury levels than whitefish and other species that feed on organisms lower down the food chain (Figure 3).

There are wide variations among water bodies in the mercury concentrations found in fish of the same species and size. Figure 4 shows the variability in mercury levels in walleye flesh from three natural systems (unaffected by industrial discharges) in Ontario. The variability stems from differences in physi-

cal, chemical and biological conditions within individual water bodies.

As well as the sport fish contaminant monitoring program, the Ministry of Environment and Energy also has a Young-of-the-Year Program which can detect responses to more localized contamination sources and provide an early indication of anticipated contaminant trends in sport fish. The program tests for contaminants in species such as spottail shiners, common shiners and juvenile yellow perch, which tend to stay in a more localized area than the sport fish species. Trend information has been obtained by this program as a result of long-term monitoring in a large number of Great Lakes locations.

Additional information on mercury and other contaminants can be found in the Ministry of Environment and Energy's publication, "A Reference Manual of Chemical Contaminants in Ontario Sport Fish".

Fish Identification

Identification des poissons

The consumption advice provided in this book is related to specific species of fish and, in order to use the information properly, it is important to correctly identify the species of fish caught.

On the following pages are sketches of the types of the fish most commonly sought in Ontario. Accompanying each picture is a brief description of the length and weight ranges of the adult fish that anglers are likely to catch from Ontario's lakes and streams. For those fishermen lucky enough to land a "lunker", the record size of many species are provided for comparison.

Information on the distribution (D), spawning time (S) and food consumed (F) is also provided.

The fish illustrations were drawn by University of Toronto student Rebecca Brehner, with the exception of the muskellunge and the sturgeon, which were drawn by Andreas Radman of the Ontario Ministry of Environment and Energy. These illustrations were redrawn based on original fish illustrations from two publications: Bulletin 184, Fisheries Research Board of Canada - "Freshwater Fishes of Canada" by Scott and Crossman, and "Fish of Ontario" (poster) distributed by the Ministry of Natural Resources.

Les conseils de consommation donnés dans le présent guide portent sur des espèces particulières de poisson et, pour tirer parti de cette information, il importe d'identifier correctement les espèces que l'on prend.

On trouvera dans les pages qui suivent des croquis des types de poissons qui se pêchent le plus souvent en Ontario. Chaque image est accompagnée d'une brève description indicative de la fourchette de dimensions et de poids où se situent les poissons adultes que le pêcheur à la ligne a des chances de prendre dans les lacs et les cours d'eau de l'Ontario. Pour ceux qui auraient la chance de sortir une « grosse pièce », la taille record est indiquée pour beaucoup d'espèces aux fins de comparaison.

On donne également des renseignements sur l'habitat des poissons (H), leurs périodes de frai (F), et leur nourriture (N).

Les croquis des poissons ont été réalisés par Rebecca Brehner, étudiante à l'Université de Toronto, sauf ceux du maskinongé et de l'esturgeon, qui sont l'œuvre d'Andreas Radman, du ministère de l'Environnement et de l'Énergie de l'Ontario. Les croquis ont été faits à partir d'illustrations originales tirées de deux publications : le bulletin 184 de l'Office des recherches sur les pêcheries du Canada, « Freshwater Fishes of Canada », de Scott et Crossman et « Poissons de l'Ontario » affichée diffusée par le ministère des Richesses naturelles de l'Ontario.

Northern Pike Brochet

Length/longueur 45-100 cm
18-39 in/lpo
Weight/poids 0.7-8.0 kg
1.5-17.5 lb
Record (Ontario) 19.11 kg
42.13 lb

D: quiet, heavily vegetated waters throughout Ontario

S: early spring

F: adults consume fish, but also take ducklings, frogs, and small muskrats

H: eaux riches en végétation dans tout l'Ontario

F: début du printemps

N: le poisson adulte se nourrit de poisson et aussi de canards, de grenouilles et de petits rats musqués

Pike

Cheek fully scaled, upper half of opercle only scaled, 10 pores on undersides of lower jaw. Northern pike. (*E. lucius*)

Cheek/Joue

Muskie

Cheek and opercle both scaled only on upper half, 12-18 pores on undersides of lower jaw. Great Lakes muskellunge (*E. masquinongy*)

Cheek/Joue

Muskellunge Maskinongé

Length/longueur 71-117 cm
28-46 in/lpo
Weight/poids 3.5-16.0 kg
8-35 lb
Record (Ontario) 147.3 cm/29.48 kg
58 in/lpo/65.0 lb

D: quiet, weedy areas of lakes and rivers

S: spring

F: mainly fish, but also cray fish, frogs, mice, muskrats and waterfowl

H: eaux tranquilles et herbeuses des lacs et rivières
S: printemps
N: principalement du poisson, mais aussi des écrevisses, grenouilles, souris, rats musqués et oiseaux aquatiques

Walleye Doré

Length/longueur 25-85 cm
10-33 in/po
Weight/poids 0.25-6.0 kg
0.5-13 lb
Record (Ontario) 92.7 cm/10.09 kg
36.5 in/po/22.25 lb

D: mainly cold, clear waters throughout Ontario
S: early spring
F: mainly fish

H: principalement eaux froides et claires dans tout l'Ontario
F: début du printemps
N: surtout du poisson

Sauger Doré noir

Length/longueur 25-41 cm
10-16 in/po
Weight/poids 1 to 0.5 kg
1.0 lb
Record (Ontario) 56.4 cm/2.0 kg
22.2 in/po/4.4 lb

D: large, shallow, turbid waters throughout Ontario
S: late May and early June
F: fish, insects and freshwater shrimp

H: vastes étendues d'eau trouble peu profonde dans tout l'Ontario
F: fin mai, début juin
N: poisson, insectes et crevettes d'eau douce

Yellow Perch Perchaude

Length/longueur 15-30 cm
6-12 in/po
Weight/poids 0.2 to 0.3 kg
0.4 to 0.7 lb
Record (Ontario) 34.3 cm/0.86 kg
13.5 in/po/1.9 lb

D: clear waters with some vegetation throughout Ontario
S: April or May
F: insects, crayfish, snails and fish

H: eaux claires contenant un peu de végétation dans tout l'Ontario
F: avril ou mai
N: insectes, écrevisses, escargots et poisson

Smallmouth Bass Achigan à petite bouche

Length/longueur 25-50 cm
10-20 in/po
Weight/poids 0.5-2.3 kg
1-5 lb
Record (Ontario) 61.0 cm/4.46 kg
24 in/po/9.64 lb

D: clear, rocky waters with little vegetation from Southern Ontario to Timiskaming
S: June
F: fish, crayfish, insects

H: eaux claires et rocheuses contenant peu de végétation du Sud de l'Ontario à Timiskaming
F: juin
N: poisson, écrevisses et insectes

Largemouth Bass Achigan à grande bouche

Length/longueur 25-55 cm
10-22 in/po
Weight/poids 0.3-2.3 kg
0.7-5 lb
Record (Ontario) 4.74 kg
10.48 lb

D: warm, weedy, slow or still waters with mud bottoms, in Southern Ontario
S: June
F: mainly fish, but also crayfish and frogs

H: eaux chaudes, herbeuses, lentes ou tranquilles, à fond vaseux, dans le Sud de l'Ontario
F: juin
N: tout du poisson, mais aussi des écrevisses et des grenouilles

Rock Bass Crapet de roche

Length/longueur 15-20 cm
6-8 in/po
Weight/poids 0.2 to 0.45 kg
0.5-1 lb

D: warm, clear, shallow, slow waters with gravel or rocky bottoms, northward to Lake Abitibi
S: spring
F: insects, crayfish, small fish

H: eaux chaudes, claires, peu profondes à fond de roches ou de gravier jusqu'au lac Abitibi au nord
F: printemps
N: insectes, écrevisses, petits poissons

Chinook Saumon chinook

Length/longueur 30-100 cm

Weight/poids 12-39 m/po

Record (Ontario) 0.5-18.0 kg

D: primarily a lake fish throughout Great Lakes

and introduced from Pacific West Coast

S: migrates up river to spawn from December to May

F: insects, freshwater shrimp, fish, snails,

clams, leeches

H: *origine de la côte du Pacifique; poisson vivant*

actuellement dans les lacs de la région des Grands Lacs

F: *remonte les rivières pour frayer de décembre à mai*

N: *insectes, crevettes d'eau douce, poissons, escargots,*

capillages et sangsues

Coho Saumon coho

Length/longueur : 30-75 cm
12-30 in/po
Weight/poids : 0.5-8.0 kg
1-18 lb
Record (Ontario) : 88.9 cm/12.08 kg
35.0 in/po/26.64 lb

Mouth dark
gums whitish
Bouche sombre
gencives blanchâtres

13-15 Anal rays
12 à 15 rayons anaux

D : introduced into Great Lakes in the mid 1960s
from Pacific West Coast
S : swims up rivers in late fall to spawn at maturity,
dies after spawning
F : mainly smelt and alewives

H : originaire de la côte du Pacifique, introduit dans les
Grands Lacs au milieu des années 1960
F : remonte les rivières pour frayer à maturité en automne,
meurt ensuite
N : surtout des éperlans et des alevins

Atlantic Salmon Saumon de l'Atlantique

Length/longueur : 25-70 cm
10-28 in/po
Weight/poids : 0.9-3.6 kg
2-8 lb
Record (Ontario) : 88.9 cm/11.02 kg
35 in/po/24.30 lb

D : recently stocked in Lake Ontario and Trout Lake
(North Bay)
S : fall; may enter rivers from mid-summer; can
spawn more than once
F : mainly smelt and alewives in Lake Ontario

H : introduit récemment dans le lac Ontario et le lac Trout
(North Bay)
F : automne; peut remonter les rivières dès le milieu de l'été;
peut frayer plusieurs fois
N : surtout des éperlans et des alevins dans le lac Ontario

Lake Trout Truite de lac

Length/longueur : 30-80 cm
12-31 in/po
Weight/poids : 0.27-4.5 kg
0.6-10 lb
Record (Ontario) : 130.8 cm/28.63 kg
51.5 in/po/63.1 lb

D : cool waters of deep lakes throughout much of
Ontario
S : October
F : fish, insect larvae and plankton

H : eaux fraîches des lacs profonds dans tout l'Ontario
F : octobre
N : poissons, larves d'insectes et plancton

Brown Trout Truite brune

Length/longueur : 15-65 cm
6-16 in/po
Weight/poids : 0.2-4.5 kg
0.5-10 lb
Record (Ontario) : 14.91 kg
32.88 lb

D : introduced from Europe into Southern Ontario
S : year
F : fall
insects, fish, crayfish, worms

H : originaire d'Europe, introduit dans les cours d'eau
du Sud de l'Ontario
F : automne
N : insectes, poissons, écrevisses et vers

Brook Trout Truite mouchetée

Length/longueur : 15-40 cm
6-16 in/po
Weight/poids : 0.2-0.9 kg
0.5-2 lb
Record (Ontario) : 80.0 cm/6.58 kg
31.5 in/po/14.5 lb

D : cool, clear streams and small lakes
S : late fall
F : insects, fish, crayfish, clams, snails

H : cours d'eau fraîche et limpide et petits lacs
F : fin de l'automne
N : insectes, poissons, écrevisses, coquillages et escargots

Whitefish Grand corégone

Length/longueur : 30-65 cm
12-26 in/po
Weight/poids : 0.3-4.0 kg
0.5-9 lb
Record (Ontario) : 81.3 cm/6.53 kg
32.0 in/po/14.38 lb

D: many inland lakes from Great Lakes to Hudson Bay
S: November and December
F: aquatic insect larvae, clams, snails and plankton

H: *lacs intérieurs, des Grands Lacs à la baie d'Hudson*
F: *novembre et décembre*
N: *larves d'insectes aquatiques, coquillages, escargots et plancton*

Profiles of whitefish and herring showing differences due to position of snout or upper jaw.

Whitefish

A: The mouth is overhanging by the snout or upper jaw; rounded profile. Whitefish (*Coregonus clupeaformis*).

Cisco

B: The mouth is not overhanging by the snout; pointed profile. Lake herring (*Coregonus artedii*).

Cisco (Lake Herring) Cisco de lac (Hareng de lac)

Length/longueur : 20-30 cm
8-12 in/po
Weight/poids : 0.3-0.5 kg
0.5-1 lb

Record (Ontario) : 59.7 cm/1.96 kg
23.5 in/po/3.3 lb

D: cold waters throughout Great Lakes to Hudson Bay
S: November or December
F: mainly plankton, but also aquatic insects, clams and snails

H: *eaux froides des Grands Lacs à la baie d'Hudson*
F: *novembre ou décembre*
N: *principalement du plancton, mais aussi des insectes aquatiques, coquillages et escargots*

Channel Catfish Barbue de rivière

Length/longueur : 36-53 cm
14-21 in/po
Weight/poids : 0.9-1.8 kg
2-4 lb

D: Great Lakes and larger lakes and rivers in Southern Ontario and parts of Northern Ontario
S: spring or summer
F: fish, aquatic insects, crayfish, clams and snails

H: *Grands Lacs et lacs ou rivières plus importants du Sud de l'Ontario et de certaines régions du Nord*
F: *printemps ou été*
N: *poissons, insectes aquatiques, écrevisses, coquillages et escargots*

Brown Bullhead Barbotte brune

Length/longueur : 20-36 cm
8-14 in/po
Weight/poids : 0.3-0.45 kg
0.8-1 lb

Record (Ontario) : 41.3 cm/1.07 kg
16.25 in/po/2.38 lb

D: warm, slow waters throughout Southern Ontario and parts of Northern Ontario
S: spring
F: insect larvae, crayfish, worms, clams, snails, fish and plant material

H: *eaux chaudes et tranquilles du Sud de l'Ontario et de certaines régions du Nord*
F: *printemps*
N: *larves d'insectes, écrevisses, vers, coquillages, escargots, poisson et plantes*

Carp Carpe

Length/longueur : 30-75 cm
12-30 in/po
Weight/poids : 0.5-11.0 kg
1-24 lb

D: widely introduced into Ontario in shallow, fairly warm waters
S: June and July
F: insects larvae, crayfish, snails and plants

H: *très commune dans tout l'Ontario dans les eaux peu profondes et relativement chaudes*
F: *juin et juillet*
N: *larves d'insectes, écrevisses, escargots et plantes*

Round Whitefish Ménomini rond

Length/longueur 20-40 cm
8-16 in/po
Weight/poids average 0.45 kg
moyen 1.0 lb

D: usually found in deep lakes in Southern Ontario and Great Lakes
S: fall
F: bottom feeder, eating aquatic insect larvae, clams and snails

H: d'ordinaire, lacs profonds du Sud de l'Ontario et des Grands Lacs
F: automne
N: se nourrit au fond de l'eau: larves d'insectes aquatiques, coquillages et escargots

White Sucker Meunier noir

Length/longueur 30-50 cm
12-20 in/po
Weight/poids 0.45-0.9 kg
1-2 lb

D: warm shallow lakes and tributary rivers of larger lakes
S: spring
F: sucks up bottom material for aquatic insects, clams, worms, and aquatic plant material

H: lacs chauds et peu profonds et rivières se jetant dans des lacs plus étendus
F: printemps
N: aspire la vase du fond pour y trouver des insectes aquatiques, des escargots, des vers, et des plantes

Redhorse Sucker Suceur rouge

Length/longueur 30-45 cm
12-18 in/po
Weight/poids 0.45-0.9 kg
1-2 lb

D: throughout Ontario
S: spring
F: sucks up bottom material for aquatic insects, snails and clams

H: tout l'Ontario
F: printemps
N: aspire la vase du fond pour y trouver des insectes aquatiques, des escargots et des coquillages

White Bass Bar blanc

Length/longueur 20-30 cm
8-12 in/po
Weight/poids to 0.7 kg
1.5 lb
Record (Ontario): 1.3 kg
2.9 lb

D: clear waters near rock reefs and sand bars in lower Great Lakes area
S: spring
F: small fish, insects, small plant material and crayfish

H: eaux claires près des barres de roches et de sable dans les régions inférieures des Grands Lacs
F: printemps
N: petits poissons, insectes, petites plantes et écrevisses

White Perch Bar-perche

Length/longueur 15-25 cm
6-10 in/po
Weight/poids 0.2-0.5 kg
0.5-1 lb

D: Lake Ontario, Lake Erie, lower Niagara River and Welland Canal
S: May and June
F: insects and fish

H: lac Ontario, lac Érié, partie inférieure de la rivière Niagara et canal Welland
F: mai et juin
N: insectes et poissons

Freshwater Drum Malachigan

Length/longueur 45-50 cm
18-20 in/po
Weight/poids 0.5-1.0 kg
1-2 lb
Record (Ontario): 78.7 cm/31 kg
31.0 in/po/20.6 lb

D: large shallow waterbodies with mud or sandy bottoms
S: spring or early summer
F: feed on bottom, eating snails, crayfish, fish and insects

H: grandes étendues d'eau peu profonde au fond vaseux ou sablonneux
F: printemps au début de l'été
N: se nourrit au fond de l'eau d'escargots, d'écrevisses, de poissons et d'insectes

White Crappie Marigane blanche

Length/longueur 20-30 cm
8-12 in/po
Record (Ontario) 38.1 cm/150 kg
15.0 in/po/1.98 lb

- D: mouths of tributary streams or weedy sheltered bays in lower Great Lakes area
S: late spring or early summer
F: aquatic insects, small fish

- H: embouchure des cours d'eau affluents ou baies abritées et herbeuses de la région inférieure des Grands Lacs
F: fin du printemps au début de l'été
N: insectes aquatiques, petits poissons

Black Crappie Marigane noire

Length/longueur 18-25 cm
7-10 in/po
Weight/poids 0.25-0.5 kg
0.5-1 lb
Record (Ontario) 43.2 cm/1.71 kg
17 in/po/3.78 lb

- D: clear, weedy lakes and slow rivers northward to South Ste. Marie
S: May and June
F: small fish, insects and crayfish

- H: lacs clairs et herbeux et rivières lentes au sud de South Ste. Marie
F: mai et juin
N: petits poissons, insectes et écrevisses

Pumpkinseed Crappet-soleil

Length/longueur 18-23 cm
7-9 in/po
Weight/poids: less than/moins de 0.2 kg
0.5 lb

- D: clear, shallow weedy waters northward to Temagami
S: spring
F: small fish, insects and crayfish

- H: eaux claires et herbeuses au sud de Temagami
F: printemps
N: petits poissons, insectes et écrevisses

Ling (Burbot) Lotte

Length/longueur to 38 cm
15 in/po

- D: cool waters of lakes and rivers, throughout Ontario
S: late winter or early spring
F: fish, crayfish, freshwater shrimp and insects

- H: eaux fraîches des lacs et des rivières dans tout l'Ontario
F: fin de l'hiver au début du printemps
N: poissons, écrevisses, crevettes d'eau douce et insectes

American Eel Anguille d'Amérique

Length/longueur 61-91 cm
2-3 ft/po

- D: mainly in St. Lawrence River and Ottawa River drainage, and Lake Ontario
S: adults spawn once in Atlantic Ocean in fall, then die; young return to lakes and rivers in spring
F: fish, aquatic insect larvae, crayfish, snails, earthworms

- H: surtout le bassin du fleuve Saint-Laurent et de la rivière des Outaouais et lac Ontario
F: les adultes fraient une fois dans l'océan Atlantique en automne puis meurent, les jeunes poissons reviennent dans les lacs et rivières au printemps
N: poissons, larves d'insectes aquatiques, écrevisses, escargots et vers de terre

Bowfin Poisson castor

Length/longueur 46-61 cm
18-24 in/po
Weight/poids 0.9-1.4 kg
2-3 lb
Record (Ontario) 81.3 cm/6.15 kg
32 in/po/13.56 lb

- D: swampy vegetated bays of warm lakes and rivers
S: spring
F: fish, crayfish, frogs

- H: baies marécageuses et herbeuses des lacs et des rivières d'eau chaude
F: printemps
N: poissons, écrevisses, grenouilles

Bluegill Crapet arlequin

Length/longueur : 15-30 cm
6-12 m/po
Record (Ontario) : 24.8 cm/0.98 kg
9.76 m/po/0.88 lb

D : warm, vegetated still waters throughout Southern Ontario
S : spring and summer
F : insects, vegetation

H : eaux chaudes et tranquilles colonisées par des plantes
dans tout le Sud de l'Ontario
F : printemps et été
N : insectes et végétation

Goldeye Laquache aux yeux d'or

Length/longueur : 25-38 cm
10-15 m/po
Record (Ontario) : 36.5 cm/0.48 kg
14.4 m/po/1.06 lb

D : parts of NE & NW Ontario often in swift silty waters
S : spring
F : insects, snails, crayfish, fish

H : régions du N-E et du N-O de l'Ontario, souvent dans les eaux rapides et alluviales
F : printemps
N : insectes, escargots, crevettes et poissons

Mooneye Laquache argentée

Length/longueur : 25-30 cm
10-12 m/po

D : clear rivers and shallows waters of lakes
S : spring
F : fish, insects, snails and small plant matter

H : rivières claires et eaux peu profondes des lacs
F : printemps
N : poissons, insectes, escargots et petites plantes

Sturgeon Esturgeon de lac

Length/longueur : 90-145 cm
3-5 m/po
Weight/poids : 4.5-36 kg
10-80 lb

D : larger rivers and lakes, usually in depths less than 30 feet
S : spring; attain great ages, not maturing until about 20 years of age
F : bottom feeder, consuming insect larvae, snails and crayfish

H : grands lacs et rivières, d'ordinaire à moins de 30 pieds de profondeur
F : printemps; vit longtemps et ne parvient pas à maturité avant environ 20 ans
N : se nourrit au fond de larves d'insectes, d'escargots et d'écrevisses

Rainbow Smelt Éperlan arc-en-ciel

Length/longueur : 15-25 cm
6-10 m/po

D : throughout Great Lakes area
S : late April
F : small fish, small aquatic life, worms

H : toute la région des Grands Lacs
F : fin avril
N : petits poissons, petites créatures aquatiques, vers

Fish Names!

Noms des poissons!

English Common Name	Nom français	Scientific Name Nom scientifique
Sea Lamprey	Lamproie marine	<i>Petromyzon marinus</i> (Linnaeus)
Sturgeon, Lake Sturgeon	Esturgeon de lac, charbonnier	<i>Acipenser fulvescens</i> Rafinesque
Longnose Gar	Lépisosté osseux	<i>Lepisosteus osseus</i> (Linnaeus)
Bowfin, dogfish, lawyer	Poisson-castor	<i>Amia calva</i> Linnaeus
Alewife	Gaspereau	<i>Alosa pseudoharengus</i> (Wilson)
Gizzard Shad, Sawbelly	Alose à gésier	<i>Dorosoma cepedianum</i> (Lesueur)
Atlantic Salmon	Salmon de l'Atlantique	<i>Salmo salar</i> Linnaeus
Pink Salmon	Salmon rose	<i>Oncorhynchus gorbuscha</i> (Walbaum)
Coho Salmon	Salmon coho	<i>Oncorhynchus kisutch</i> (Walbaum)
Kokanee Salmon	Salmon nerka	<i>Oncorhynchus nerka</i> (Walbaum)
Chinook Salmon	Salmon chinook	<i>Oncorhynchus tshawytscha</i> (Walbaum)
Rainbow Trout, Steelhead Trout	Truite arc-en-ciel	<i>Oncorhynchus mykiss</i> (Walbaum)
Brown Trout	Truite brune	<i>Salmo trutta</i> Linnaeus
Brook trout, Speckled Trout, Square-tail, aurora Trout	Truite mouchetée, ombre de fontaine	<i>Salvelinus fontinalis</i> (Mitchill)
Lake Trout, Grey Trout, Laker, Namaycush	Truite de lac, truite grise, touladi	<i>Salvelinus namaycush</i> (Walbaum)
Siscowet, fat Lake Trout, fat	Siscowet	<i>Salvelinus namaycush siscowet</i> (Agaassiz)
Splake, Wendigo	Truite moulac	Hybrid of <i>Salvelinus namaycush</i> (Walbaum) and <i>Salvelinus fontinalis</i> (Mitchill)

English Common Name	Nom français	Scientific Name Nom scientifique
Blouater, Hov's Cisco	Cisco de fumage	<i>Coregonus hoyi</i> (Gill)
Whitefish, Lake Whitefish	Grande corégone	<i>Coregonus clupeaformis</i> (Mitchill)
Round Whitefish, Menominee	Menomini rond	<i>Prosopium cylindraceum</i> (Pallas)
Rainbow Smelt, Smelt	Éperlan arc-en-ciel, Éperlan du nord	<i>Osmerus mordax</i> (Mitchill)
Goldeye, Winnipeg Goldeye	Laquette aux yeux d'or	<i>Hiodon alosoides</i> (Rafinesque)
Mooneye	Laquette argentée	<i>Hiodon tergisus</i> (Lesueur)

Response to 1992 Guide Questionnaire

Every third year questionnaires are distributed with the Guide requesting information that is used to improve future editions of the Guide. Information is requested on fish consumption patterns, preferred fishing locations and fish species caught and consumed. In addition, respondents are asked to provide comments and suggestions on the Guide.

In 1992, mail-in questionnaires were enclosed in 10,000 copies of the Guide. A total of 494 responses were tabulated. This level of response is considered to be excellent, well above average for this type of survey. Many thanks are extended to those who took the time and effort to fill in and return questionnaires.

The results and suggestions received in the questionnaires are summarized below:

1. Over 86% of the respondents have used the Guide in previous years.
2. Over 75% of the respondents indicate that their fishing and/or fish-consumption habits have changed after consulting the Guide. Those individuals whose habits have not changed indicate that it is because they do not eat fish, do not catch or eat a large amount of fish, that the areas they fish are not listed in the Guide, or the fish they catch are in the unlimited consumption category.
3. Over 75% of the respondents indicate that the Guide meets their needs and includes information on all or most of the water bodies they are interested in.
4. The most frequently fished Great Lake is Lake Ontario, while Lake Simcoe is the most frequently fished inland lake, and the Credit and Grand Rivers are the most frequently fished rivers. Table 1 lists the ten most frequently fished locations.
5. Over 64% of the respondents fish at least once every two weeks.

3. Location maps

Page size limitations preclude the inclusion of maps of a reasonable scale. However, readers can make use of the Ontario road map or, for more detail, Canadian government topographical maps. By referring to the latitude and longitude references given in the Guide for each site and those included in the margins of these maps, most sites can be located.

4. Testing for more contaminants

The specific contaminants tested in fish vary from site to site. It is the intent of the program to test fish from a water body for all contaminants likely to be found at a site and which could accumulate in fish to levels harmful to human health. Consequently, at a number of Great Lakes locations, fish have been tested for over 70 contaminants, whereas, at other locations such as isolated inland lakes, testing is carried out for mercury only. This program is the largest of its kind in North America, with more contaminants being tested for in more sport fish than in any other program.

A detailed report on the results of the 1992 questionnaire may be obtained by written request to:

Ontario Ministry of Environment and Energy
Sport Fish Contaminant Monitoring Program
Questionnaire Report
Water Resources Branch
135 St. Clair Avenue West
Toronto, Ontario M4V 1P5

6. Walleye is the most frequently caught and consumed sport fish species (two-thirds of the respondents who consume sport fish ate one or more meals of walleye in the previous year). Smallmouth bass and yellow perch are also frequently consumed. Table 2 lists the ten most frequently caught and consumed sport fish species.

7. The average meal size of sport fish is 276 gm (9.7 oz). The most common frequency for consuming sport fish is once a month.

8. The average meal size of commercially purchased fish is 237 gm (8.3 oz) and the most common frequency of consumption is once a month. Saltwater species such as halibut and cod are consumed much more frequently than freshwater commercial species.

Users' Suggestions

Respondents were given the opportunity to provide additional comments. The most frequent suggestion is that more water bodies and more species should be tested. Other common suggestions include adding coloured pictures of fish, more location maps and to test for more contaminants. Each of these suggestions is discussed below:

1. Sample more water bodies and fish species

The sites and species most frequently requested in the survey will be included in future sampling programs. It is neither economically feasible nor necessary to test all fish species in a particular water body. A full explanation of the criteria used to select sites and fish species for testing is given on page 4.

2. Coloured pictures of fish

Coloured pictures of Ontario sport fish in the form of a poster can be obtained through the Ministry of Natural Resources. Primarily for cost reasons, the decision has been made to retain the black and white illustrations.

Table 1

The most frequently fished lakes and rivers in the 1992 survey.

Lake/River % of Respondents

a) Ten Most Popular Angling Areas

1. Lake Ontario	31.2
2. Lake Huron	29.7
3. Lake Simcoe	22.2
4. Lake Erie	22.0
5. Credit River	14.4
6. Grand River	14.2
7. Trent River	11.7
8. Lake Scugog	11.7
9. Rice Lake	10.3
10. Thames River	9.7

b) Inland Lakes

1. Lake Simcoe	22.2
2. Lake Scugog	11.7
3. Rice Lake	10.3
4. Lake Nipissing	9.2
5. Pigeon Lake	7.3
6. Lake St. Clair	6.5
7. Balsam Lake	6.5
8. Buckhorn Lake	5.9
9. Sturgeon Lake	5.4
10. Stony Lake	5.4

c) Rivers

1. Credit River	14.4
2. Grand River	14.2
3. Trent River	11.7
4. Thames River	9.7
5. Saugeen River	9.2
6. Nottawasaga River	8.8
7. Ganaraska River	8.6
8. French River	8.4
9. Niagara River	6.9
10. St. Lawrence River	4.6

Table 2

Species % of Respondents

1. Walleye	66.9
2. Smallmouth Bass	58.0
3. Yellow Perch	44.4
4. Rainbow Trout	37.6
5. Largemouth Bass	37.6
6. Northern Pike	36.3
7. Lake Trout	34.7
8. Brook Trout	23.7
9. Chinook Salmon	22.2
10. Rock Bass	20.2

Résultats du sondage de 1992 sur le guide

Une fois tous les trois ans le Guide pour la consommation du poisson gibier de l'Ontario est accompagné d'un questionnaire visant à recueillir de l'information permettant d'améliorer les versions ultérieures du guide. On y demande des renseignements sur les habitudes de consommation des pêcheurs, sur les emplacements privilégiés et sur les espèces de poissons pêchées. On demande aussi aux répondants leurs commentaires et leurs suggestions en ce qui a trait au guide.

En 1992, 10 000 questionnaires pré-affranchis ont été distribués avec le guide. De ce nombre, 494 questionnaires remplis nous ont été retournés, soit un taux de réponse très élevé compte tenu du type de sondage. Nous remercions chaleureusement les personnes qui ont pris la peine d'y participer.

Voici un sommaire des résultats du sondage :

1. Plus de 86 p. 100 des répondants avaient déjà utilisé le guide les années précédentes.
2. Plus de 75 p. 100 des répondants ont déclaré que leurs habitudes de pêche et de consommation de poisson gibier ont changé après avoir consulté le guide. Les répondants qui ont déclaré ne pas avoir changé leurs habitudes étaient ceux qui ne consommaient pas de poisson, qui n'en pêchaient ou n'en mangeaient pas en grandes quantités, qui pêchaient à des endroits qui ne figurent pas dans le guide ou dont les prises faisaient partie de la catégorie de poissons qui ne font l'objet d'aucune restriction.
3. Plus de 75 p. 100 des répondants ont déclaré que le guide convenait parfaitement à leurs besoins et qu'il renfermait des données sur tous, ou presque tous, les plans d'eau qui les intéressaient.
4. Le Grand Lac le plus pêché est le lac Ontario, tandis que le lac intérieur le plus prisé des pêcheurs est le lac Simcoe. Par ailleurs, les cours d'eau les plus populaires auprès des pêcheurs sont les rivières Credit et Grand. Le tableau 1 donne une liste des dix plans d'eau les plus populaires auprès des pêcheurs.

l'Ontario auprès du ministère des Richesses naturelles. Il a été décidé, pour des raisons économiques, de continuer à utiliser les illustrations en noir et blanc dans le guide.

3. Cartes des emplacements

Le format du guide ne permet pas d'y inclure des cartes plus précises. L'utilisateur peut toutefois utiliser une carte routière de l'Ontario ou, pour plus de précision, une carte topographique du gouvernement fédéral. Le guide donne la latitude et la longitude des plans d'eau, il est donc facile de localiser les emplacements sur une carte.

4. Analyse d'un plus grand nombre de contaminants

Les contaminants analysés varient d'un emplacement à l'autre. L'objectif du programme est d'analyser les poissons d'un plan d'eau donné pour toutes les substances polluantes susceptibles d'y être présentes et dont l'accumulation dans la chair des poissons pose un risque pour la santé des pêcheurs qui les consomment. Ainsi, dans certaines régions des Grands Lacs, les analyses ont porté sur plus de 70 contaminants, tandis que d'autres plans d'eau intérieurs ne font l'objet que d'une détermination de la teneur en mercure. Le Programme ontarien de surveillance de la contamination du poisson gibier est la plus ambitieuse initiative du genre en Amérique du Nord. Les analyses effectuées dans le cadre de ce programme portent sur plus de contaminants que tout autre programme semblable.

On peut se procurer un rapport détaillé sur les résultats du questionnaire de 1992 en faisant une demande par écrit à l'adresse suivante :

Programme de surveillance de la contamination du poisson gibier

Ministère de l'Environnement et de l'Énergie de l'Ontario

Rapport sur le questionnaire

Direction des ressources en eau

135, avenue St. Clair ouest

Toronto (Ontario) M4V 1P5

5. Plus de 64 p. 100 des répondants vont à la pêche au moins une fois toutes les deux semaines.

6. Le doré est l'espèce de poisson la plus pêchée et la plus consommée (les deux tiers des répondants qui consomment le poisson gibier avaient pris un ou deux repas de doré pendant l'année). L'achigan à petite bouche et la perchaude sont aussi souvent consommés. Le tableau 2 donne une liste des dix espèces de poissons les plus souvent pêchées et consommées.

7. Le repas moyen de poisson gibier est de 276 g (9,7 oz). La fréquence de consommation habituelle est d'un repas par mois.

8. Le repas moyen de poisson commercial est de 237 g (8,3 oz) et la fréquence de consommation habituelle est d'un repas par mois. Les poissons d'eau salée telles que le flétan et la morue sont consommées beaucoup plus souvent que les espèces d'eau douce.

Suggestions des utilisateurs du guide

Les répondants ont aussi eu l'occasion de faire connaître leurs commentaires sur le guide. La suggestion la plus fréquente avait trait à l'analyse d'un plus grand nombre de plans d'eau et d'espèces de poissons. Les utilisateurs ont aussi demandé que le guide renferme des illustrations en couleurs des poissons, un plus grand nombre de cartes et que l'analyse porte sur un plus grand nombre de contaminants. Voici la réponse à chacune de ces suggestions :

- 1. Analyse d'un plus grand nombre de plans d'eau et d'espèces de poissons**
Les emplacements et les espèces de poissons qui ont fait l'objet du plus grand nombre de demandes d'analyse seront inclus dans les prochains programmes d'échantillonnage. Il serait très coûteux de faire l'analyse de toutes les espèces de poissons dans chaque plan d'eau visé et de toute façons cela n'est pas nécessaire. Lire la page 4 du présent guide pour en savoir plus long sur le choix des emplacements et des espèces à analyser.

- 2. Illustrations en couleurs des poissons**
On peut se procurer une affiche en couleurs des espèces de poisson gibier de

6. Brochet	36,3
7. Truite de lac	34,7
8. Truite mouchetée	23,7
9. Saumon Chinook	22,2
10. Crapet de roche	20,2

Veuillez noter que pour certains endroits, des renseignements sur la consommation peuvent être donnés pour des espèces de poissons qu'il est interdit d'avoir en sa possession en vertu des règlements de la pêche de l'Ontario. La même restriction s'applique à des poissons de certaines tailles. Les pêcheurs devraient consulter les *Règlements de la pêche sportive de l'Ontario — Résumé 1992* et la mise à jour de 1993 pour s'assurer que la pêche est permise sur un plan d'eau en particulier, et qu'il est permis de conserver tous les poissons capturés. On peut obtenir ces publications en s'adressant au Centre d'information du ministère des Richesses naturelles (Edifice Macdonald, 900 rue Bay, bureau M1-73, Toronto (Ontario) M7A 2C1, aux bureaux locaux du ministère des Richesses naturelles et aux endroits qui délivrent des permis de pêche.

Guide de consommation du poisson gibier

Fréquence de consommation					
Consommation à long terme	Pas de restriction	0,2 kg/sem (0,5 lb/sem)	0,1 kg/sem (0,3 lb/sem)	1 ou 2 repas par mois 0,5 kg/mois (1 lb/mois)	Aucun
Vacances d'une semaine	Pas de restriction	10 repas 2,3 kg (5 lb)	7 repas 1,5 kg (3 lb)	1 ou 2 repas 0,5 kg (1 lb)	Aucun
Vacances de deux semaines	Pas de restriction	5 repas par sem 1,3 kg/sem. (2,8 lb/sem.)	4 repas par sem. 0,8 kg/sem. (1,9 lb/sem.)	1 ou 2 repas par sem. 0,5 kg/sem. (1,5 lb/sem.)	Aucun
Vacances de trois semaines	Pas de restriction	4 repas par sem 1 kg/sem. (2,1 lb/sem.)	3 repas par sem 0,6 kg/sem (1,4 lb/sem.)	1 ou 2 repas par sem. 0,5 kg/sem (1 lb/sem.)	Aucun

Les enfants de moins de 15 ans et les femmes en âge de procréer ne devraient manger que des poissons représentés par  .

Polluants analysés

Le chiffre indique le polluant ou groupe de polluants pour lequel le poisson a été analysé :

- 1 Mercure
- 2 Mercure, BPC, mirex et pesticides
- 3 BPC, mirex et pesticides
- 4 Mercure, BPC et mirex
- 5 Mercure, autres métaux, BPC, mirex et pesticides
- 6 Mercure et autres métaux
- 7 Dioxines et furannes
- 8 Mercure, BPC, mirex, pesticides, chlorophénols et chlorobenzènes
- 9 Hydrocarbures aromatiques polycycliques

Avant-propos

Vous trouverez dans cette dix-septième édition du *Guide pour la consommation du poisson gibier de l'Ontario* des directives pour la consommation du poisson gibier provenant de plus de 1 600 emplacements aux quatre coins de la province.

Vu que la plupart des directives restent inchangées d'une année à l'autre, et par souci d'économie, le guide complet ne sera désormais publié qu'une fois tous les deux ans. La prochaine édition du guide paraîtra donc en 1995 et à tous les deux ans par la suite.

Nous vous prions donc de conserver le présent guide pour les saisons de pêche 1993 et 1994.

Le Guide pour la consommation du poisson gibier de l'Ontario — 1993 est le fruit d'une collaboration entre de nombreux scientifiques et techniciens au service des ministères ontariens de l'Environnement et de l'Énergie et des Richesses naturelles.

Les poissons sont prélevés par des représentants du ministère des Richesses naturelles, qui les expédient aux laboratoires du ministère de l'Environnement et de l'Énergie où ils seront analysés pour déterminer la concentration des divers polluants qu'ils contiennent, dont le mercure, les BPC, le mirex et le DDT. Les résultats obtenus servent à élaborer les tableaux publiés ici. On trouve dans ces tableaux des conseils pour la consommation du poisson gibier en fonction de sa taille, de l'espèce et de la provenance. Ces conseils sont fondés sur les normes de santé établies par le gouvernement fédéral.

Il est important de noter que le prélèvement et l'analyse des poissons s'inscrivent dans le cadre d'un processus continu. Les ressources sont réparties en proportions égales entre l'analyse des nouveaux plans d'eau et l'analyse répétée des plans d'eau où la concentration de polluants est susceptible de fluctuer. En étudiant une même espèce au même endroit

sur une période de plusieurs années, les scientifiques peuvent suivre l'évolution de certains contaminants chez cette espèce. Dans certains cas, les données recueillies aident à isoler les sources de pollution et à trouver des moyens d'y remédier.

Nous vous prions de signaler toute source de pollution ou hécatombe de poissons au bureau du ministère de l'Environnement et de l'Énergie de votre région, à l'adresse qui figure plus loin dans le guide (p. 166).

Pour obtenir des renseignements sur les règlements de la pêche sportive, les limites de prises et les périodes d'ouverture, veuillez vous procurer un exemplaire des *Règlements relatifs à la pêche sportive en Ontario* à un des bureaux du ministère des Richesses naturelles, dont l'adresse figure plus loin dans le guide (p. 166).

Pour obtenir des données précises sur un emplacement donné dans le cadre du Programme de surveillance de la contamination du poisson gibier ou de plus amples renseignements sur le contenu du présent guide et des versions antérieures, veuillez vous adresser au :

Programme de surveillance de la
contamination du poisson gibier

Toronto (Ontario) M4V 1M2
Tél. : (416) 314-7886

Il est important de noter que les analyses de laboratoire sont effectuées sur le tissu non adipeux du muscle dorsal, sans arêtes ni peau, et que les directives de consommation sont établies d'après cette partie du poisson. Il est certain que d'autres parties, comme le poisson entier, les darnes ou le gras du ventre, peuvent contenir des concentrations plus élevées de substances organiques telles les BPC, le mirex, le DDT ou la 2,3,7,8 TCDD, car ces polluants s'accumulent davantage dans les tissus adipeux. Il est donc

Voici la légende des tableaux, pour le lac Deep; lac hypothétique.

- 1 Les tableaux sont divisés en trois sections par région : sud de l'Ontario, nord de l'Ontario et Grands Lacs, laquelle figure au haut de la page
- 2 Le nom de l'emplacement
- 3 Sa latitude et sa longitude
- 4 Le canton, comté ou district territorial

51 Les espèces analysées sont habituellement celles qui sont particulièrement susceptibles de présenter une concentration élevée de polluants (voir la section intitulée *Choix des espèces à analyser*)

6 La longueur totale du poisson est mesurée à partir du bout de la mâchoire jusqu'à l'extrémité de la queue. Elle est exprimée

en centimètres et en pouces (entre parenthèses).

Polluants analysés

- 7 Le chiffre indique le polluant ou groupe de polluants pour lequel le poisson a été analysé :
- 1 Mercure
 - 2 Mercure, BPC, mirex et pesticides
 - 3 BPC, mirex et pesticides
 - 4 Mercure, BPC et mirex
 - 5 Mercure, autres métaux, BPC, mirex et pesticides
 - 6 Mercure et autres métaux
 - 7 Dioxines et furannes
 - 8 Mercure, BPC, mirex, pesticides, chlorophénols et chlorobenzènes
 - 9 Hydrocarbures aromatiques polycycliques
- La fait qu'on ait recherché un groupe particulier de polluants ne signifie pas forcément que le poisson contiendra toutes ces substances. Par exemple, un poisson

analysé pour le groupe 4 peut contenir uniquement du mercure et aucune trace de BPC ou de mirex.

Dans certains endroits, les analyses portaient sur la concentration de mercure seulement, puisqu'il est le seul polluant pour lequel il y a lieu de limiter la consommation.

Symboles utilisés

Consommation illimitée

-  Il s'agit de la seule catégorie de poisson de consommation sûre pour les femmes en âge de procréer (les femmes enceintes ou qui songent à le devenir et les mères qui allaitent) et les enfants de moins de 15 ans. Aucune des substances recherchées n'a été décelée à une concentration qui puisse justifier une restriction de la consommation.

Consommation restreinte

-  Ces poissons doivent être consommés en quantité limitée, car leur concentration de mercure est de l'ordre de 0,5 à 1,0 partie par million.
-  La consommation de ces poissons est restreinte davantage, car leur teneur en mercure atteint 1,0 à 1,5 partie par million.
-  La consommation de ces poissons est restreinte, car ils contiennent un ou plusieurs polluants organiques de source industrielle,

tels les BPC ou le mirex, à une concentration supérieure à la limite fédérale.

Consommation déconseillée

-  ¹² Aucun de ces poissons ne devrait être consommé, car ils contiennent du mercure à des concentrations supérieures à 1,5 partie par million

Directives pour la consommation

Le tableau ci-dessous donne la quantité maximale de poisson gibier de l'Ontario qu'il est recommandé de consommer. Ce chiffre a été établi en fonction de la teneur en polluants et de la fréquence de consommation.

De nombreux pêcheurs ontariens prennent et consomment du poisson toute l'année. Ce sont donc des consommateurs à long terme qui ont intérêt à consulter la catégorie à leur intention dans le tableau. Certains pêcheurs, par contre, prennent et consomment du poisson uniquement pendant leurs vacances annuelles. Ces pêcheurs doivent se reporter à la catégorie pertinente selon qu'ils en consomment pendant une, deux ou trois semaines.

Les quantités maximales recommandées sont indiquées en nombre de repas et en poids total par semaine. Un repas représente 230 g (0,5 lb). Les femmes en âge de procréer et les enfants de moins de 15 ans ne devraient consommer que du poisson de la catégorie .

Guide de consommation du poisson gibier

Fréquence de consommation					
Consommation à long terme	Pas de restriction	0,2 kg/sem. (0,5 lb/sem.)	0,1 kg/sem. (0,3 lb/sem.)	1 ou 2 repas par mois 0,5 kg/mois (1 lb/mois)	Aucun
Vacances d'une semaine	Pas de restriction	10 repas 2,3 kg (5 lb)	7 repas 1,5 kg (3 lb)	1 ou 2 repas 0,5 kg (1 lb)	Aucun
Vacances de deux semaines	Pas de restriction	5 repas par sem. 1,3 kg/sem. (2,8 lb/sem.)	4 repas par sem. 0,8 kg/sem. (1,9 lb/sem.)	1 ou 2 repas par sem. 0,5 kg/sem. (1,5 lb/sem.)	Aucun
Vacances de trois semaines	Pas de restriction	4 repas par sem. 1 kg/sem. (2,1 lb/sem.)	3 repas par sem. 0,6 kg/sem. (1,4 lb/sem.)	1 ou 2 repas par sem. 0,5 kg/sem. (1 lb/sem.)	Aucun

Les enfants de moins de 15 ans et les femmes en âge de procréer ne devraient manger que des poissons représentés par .

Exemple :

Pendant un voyage de pêche de trois semaines au lac Deep, un vacancier prend un doré mesurant 40 cm (16 po) et il veut savoir si ce poisson est bon à manger. Il doit d'abord :

- Trouver le lac Deep dans les tableaux du guide :

Fish Species/ Espèces de poisson	15-20 (6-8)	20-25 (8-10)	25-30 (10-12)	30-35 (12-14)	35-45 (14-18)	45-55 (18-22)	55-65 (22-26)	65-75 (26-30)	>75 >(30)
Walleye Doré									

- Prendre note que le doré mesurant entre 35 et 45 cm (14-18 po) est suivi du symbole .
- Puisque le symbole  n'y est pas, le pêcheur sait automatiquement que le poisson ne doit pas être consommé par une femme en âge de procréer ou un enfant de moins de 15 ans.
- Si le poisson ne sera pas consommé par une femme en âge de procréer ou un enfant de moins de 15 ans, le pêcheur consultera le tableau qui figure à la deuxième page de la couverture et se reportera à la catégorie « Vacances de trois semaines ». D'après le tableau, la consommation maximale recommandée est de quatre repas, ou un kilogramme, par semaine.

Le Programme de surveillance de la contamination du poisson gibier

Choix des emplacements à analyser

Étant donné que l'Ontario compte plus de 250 000 lacs, d'innombrables rivières et ruisseaux et quantité de lieux de pêche sur les Grands Lacs, il ne serait ni pratique ni économique de les analyser tous.

- On peut décider d'analyser un emplacement pour une ou plusieurs des raisons suivantes :
- il s'agit d'une zone de pêche populaire
- il existe à proximité une source connue ou probable de pollution
- c'est une source importante de nourriture pour les habitants du lieu (cas, généralement, des lacs voisins de réserves autochtones)

- une aire de loisirs est sur le point d'y être aménagée
 - il fait partie d'un programme d'étude à long terme des contaminants du poisson
- Le choix des plans d'eau à étudier est un processus continu auquel le public est invité à participer.

Choix des espèces à analyser

La plupart des lacs et cours d'eau contiennent diverses espèces de poissons. Lorsqu'il s'agit de choisir les espèces à analyser, il convient de noter que toutes n'accumulent pas nécessairement un polluant donné à des concentrations semblables.

Ainsi, à taille égale, un poisson d'une certaine espèce peut avoir une concentration de polluants beaucoup plus faible qu'un poisson d'une autre espèce. Cela tient à des différences sur les plans de l'alimentation, de l'habitat, de la croissance et de la physiologie.

C'est ainsi que la teneur en mercure d'un poisson comme le doré ou le brochet sera probablement plus élevée, à taille égale, que chez une espèce comme le grand corégone.

En effet, le doré et le brochet, qui sont à l'extrémité de la chaîne alimentaire, sont de gros carnivores qui se nourrissent de poissons plus petits susceptibles d'avoir eux aussi une forte concentration de mercure.

Le corégone, par contre, se nourrit, à un niveau inférieur de la chaîne alimentaire, d'insectes et d'invertébrés aquatiques qui contiennent moins de mercure que les petits poissons.

La pratique est donc, quand on étudie les poissons d'une aire donnée pour déterminer leur teneur en mercure, de choisir des gros carnivores, car ils présenteront les concentrations les plus élevées. Si l'analyse des carnivores révèle de faibles concentrations, il n'y aura probablement pas lieu d'analyser d'autres espèces.

Lorsqu'on recherche des polluants organiques tels les BPC et le mirex, il convient d'étudier les espèces à chair très grasse, comme le saumon, la truite de lac, l'éperlan et la perchaude, car ces polluants

ont tendance à s'accumuler dans les tissus adipeux. Encore une fois, si les espèces à chair grasse ne renferment pas de grandes quantités de polluants organiques, les espèces à chair moins grasse n'auront probablement pas besoin d'être analysés.

Prélèvement des poissons à analyser

Les poissons sont prélevés par le personnel du ministère des Richesses naturelles, qui les prend au filet selon diverses méthodes. Autant que possible, l'échantillon comprend 20 poissons de chaque espèce, dont la longueur et le poids sont représentatifs de la gamme de tailles de cette espèce pour le lac à l'étude. On note la longueur, le poids et le sexe de chaque poisson. Un filet du muscle dorsal sans arêtes ni peau est prélevé (voir illustration), emballé et surgelé avant d'être expédié aux laboratoires du ministère de l'Environnement et de l'Énergie, à Toronto ou à Thunder Bay.

Analyse supplémentaire des lieux de pêche

Depuis la seconde moitié des années 1970, les responsables du Programme de surveillance de la contamination du poisson gibier ajoutent en moyenne 100 emplacements à la liste tous les ans. On compte aujourd'hui plus de 1 600 emplacements à analyser.

Dans le cadre de ce programme, on réanalyse aussi des lacs et rivières, s'il y a lieu. Dans les régions éloignées des activités humaines, là où les poissons sont relativement à l'abri de la pollution, toute restriction de la consommation se limite habituellement aux endroits où on a relevé une concentration élevée de mercure chez les grands et vieux individus d'espèces

carnivores, telles le doré et le brochet. Le mercure, dans ces régions, provient en grande partie de sources naturelles qui ne changent pas beaucoup avec le temps; par conséquent, la concentration de mercure chez les poissons varie très peu. Dans les régions polluées par les activités humaines, les contaminants possibles sont beaucoup plus nombreux et leur accumulation chez les poissons sera souvent proportionnelle au degré de pollution.

Les emplacements à réanalyser sont répartis en trois groupes :

- Les emplacements où la concentration d'un ou de plusieurs polluants est anormalement élevée ou change subitement. Les poissons y sont analysés à intervalles de un à trois ans, selon leur popularité auprès des pêcheurs ou selon qu'ils constituent ou non une source importante de nourriture pour les habitants de la région.
- Les emplacements où la concentration de polluants est assez stable, mais qui ont la faveur des pêcheurs à la ligne. Ces endroits sont analysés au moins tous les cinq ans.
- Tous les autres emplacements, le plus souvent des endroits éloignés des grandes sources de pollution où le taux de contamination des poissons est constant. Les poissons de ces endroits sont analysés quand les ressources le permettent, environ tous les dix ans.

Analyse des poissons

Non seulement le filet du muscle dorsal, sans arêtes ni peau, donne-t-il les résultats les plus probants, mais c'est également la partie la plus savoureuse de la plupart des poissons.

L'analyse permettant de déterminer la présence de polluants se fait aux laboratoires du ministère de l'Environnement et de l'Énergie par diverses méthodes, selon le ou les polluants auxquels on s'intéresse.

Comment nettoyer et conserver le poisson

Si l'on désire conserver et consommer le poisson que l'on a pris, il est important de le garder dans le meilleur état possible jusqu'au moment de l'apprêter. On doit mettre un poisson fraîchement pêché sur de la glace ou le réfrigérer dans les plus brefs délais pour éviter qu'il ne se gâte. Ensuite, il faut le vider, le nettoyer et le réfrigérer le plus tôt possible.

Voici une des méthodes les plus couramment employées pour vider, découper en filets et dépouiller le poisson :

- Couper la paroi ventrale de la fente anale à la tête et retirer les viscères.
- Retrancher la tête et couper les nageoires.
- Poser le poisson à plat sur la planche à découper. À l'aide d'un couteau à lame fine bien aiguisée, trancher la peau et la chair qui se trouve derrière la tête jusqu'à l'arête centrale. Puis fendre le poisson d'un bout à l'autre de la partie dorsale en glissant le couteau le long de l'arête centrale jusqu'à la queue.
- Détacher l'autre côté de la même manière.
- Pour enlever les arêtes, poser le filet sur la planche, le côté peau dessous. En insérant la lame sous les arêtes, les détacher du filet en y laissant le moins de chair possible. Retrancher ensuite la nageoire pelvienne ainsi que le gras de la partie ventrale du filet.
- Poser le filet sur la planche, le côté peau dessous. Le couteau bien à plat, glisser celui-ci entre la peau et la chair, de la queue à la tête, en remontant par petites saccades.

On obtient ainsi un filet sans peau ni arêtes. Rincer ensuite à l'eau froide et faire cuire, réfrigérer, congeler ou mariner.

Comment remettre votre prise à l'eau

Un certain nombre de pêcheurs pratiquent la pêche sportive pour vivre l'émotion de la prise, et remettent le poisson à l'eau. Si vous décidez de ne pas garder un poisson, voici quelques

mesures à prendre pour éviter de réduire ses chances de survie :

1. Il est important de faire vite. Enlever l'hameçon le plus tôt possible et relâchez le poisson. Un poisson qui a été manipulé trop longtemps ne pourra reprendre ses forces. S'il est pris en eau profonde, il doit être ramené lentement vers la surface pour qu'il puisse se faire aux changements de pression et de température.
2. Garder le poisson submergé le plus longtemps possible, car il ne peut respirer hors de l'eau. Ne pas le laisser se débattre contre le sol ou les roches. Quelques pouces d'eau suffisent pour amortir les coups.
3. Il est essentiel de manipuler le poisson avec précaution et avec les mains humides. Ne pas lui mettre les doigts dans les yeux ou les branchies. Il ne faut pas serrer les petits poissons, mais les tenir par la lèvre inférieure. Un filet pourra faciliter la tâche, mais il faut le garder sous l'eau.
4. Retirer l'hameçon le plus rapidement possible à l'aide d'une pince à bec long. Si l'hameçon s'est enfoncé profondément, couper la ligne et laisser l'hameçon là où il est. Il se dissoudra et ne nuira pas au poisson. Il ne faut surtout pas essayer d'arracher l'hameçon.
5. Pour ranimer un poisson, le tenir à la verticale dans l'eau, face au courant. Lui faire reprendre sa respiration en le déplaçant de l'avant à l'arrière pour que l'eau puisse s'infiltrer dans les branchies. Cela peut prendre quelques minutes. Relâcher le poisson quand il commence à se débattre.

Parasites

Il arrive parfois qu'un pêcheur prenne un poisson qui est infesté de vers ou de larves ou qui a des kystes ou nodules dans la chair. En nettoyant le poisson, il peut découvrir des vers dans la région intestinale ou des moisissures sur la peau, les nageoires ou les ouïes. La présence de ces parasites est tout à fait normale, car ils font partie de l'écosystème dans lequel évoluent les poissons. Même si elles ne sont pas appétissantes, les parties

comestibles qui contiennent des parasites ne présentent aucun danger pour la santé lorsqu'elles sont bien cuites.

Parmi les parasites les plus répandus chez les poissons, mentionnons les taches noires de l'achigan et de la perchaude, les sangsues, les pous et les douves des ouïes.

Tumeurs

Les pêcheurs prennent parfois des poissons qui présentent des excroissances, des tumeurs, des plaies ou des lésions. En général, celles-ci sont dues à des infections virales ou bactériennes. On trouve parfois des anomalies du foie ou des intestins chez les espèces communes telles la carpe noire et la barbotte brune; elles sont le résultat d'une infection parasitaire ou d'une tumeur. Les effets possibles de ces maladies sur les poissons et le rôle incertain de la pollution dans leur apparition ont conduit à des recherches pour déterminer la cause de ces anomalies. Parmi les excroissances d'origine virale qu'on observe sur le poisson gibier, il y a la lymphocystite, le lymphosarcome et le sarcome cutané.

La lymphocystite, maladie virale qui touche surtout le doré et la perchaude, est une maladie très répandue au Canada. Le virus infecte la peau du poisson et se transmet d'un individu à l'autre au cours des migrations printanières, à l'occasion de la fraie. Il provoque l'apparition de protubérances blanchâtres en forme de chou-fleur. La lymphocystite ne tue pas le poisson. Des études ont en effet révélé qu'il pouvait ne plus présenter d'excroissances dès le printemps suivant.

Le sarcome cutané est une autre maladie virale qui s'attaque au doré en infectant ses cellules et provoquant la croissance de tumeurs juste au-dessous de la peau. Ces protubérances s'enlèvent avec la peau du poisson.

Une étude récente effectuée par le ministère de l'Environnement et de l'Énergie et le ministère des Richesses naturelles a révèle que les dorés qui présentent des lésions cutanées telles que la lymphocystite et le sarcome cutané ne contiennent pas de concentrations de polluants plus élevées que les dorés non atteints.

Le lymphosarcome est un virus qui afflige le maskinongé et le grand brochet. Il se transmet au moment de la fraie, mais les lésions qu'il entraîne varient avec les saisons et l'évolution de la maladie. Au printemps, les individus atteints ont d'épaisses taches blanches d'où ils éliminent le virus; ces desquamations vont infecter d'autres poissons. Plus tard dans l'année, les taches peuvent se résorber et former des lésions couperosées ou même reprendre l'apparence d'une peau normale. Le virus qui est à l'origine de la maladie infecte les globules blancs du poisson et se répand dans tout l'organisme sur une période allant d'un été à plusieurs années. Le lymphosarcome peut entraîner la mort du poisson.

On a relevé des tumeurs ressemblant à des verrues sur les lèvres et la peau de poissons communs dans certaines régions des Grands Lacs. Ces tumeurs disparaissent chez les poissons placés dans des aquariums de laboratoire et sont vite remplacées par de nouvelles excroissances, ce qui suppose une origine virale de la maladie.

Selon des études effectuées des côtés canadien et américain des Grands Lacs, ces tumeurs seraient plus fréquentes dans les secteurs pollués. Là où le niveau de pollution est particulièrement élevé, on observe aussi des tumeurs du foie et des intestins.

Les études laissent suggérer que la pollution serait directement responsable des tumeurs du foie et indirectement responsable des tumeurs cutanées. Comme l'eau est souvent plus chaude dans les régions polluées, elle attire les poissons en plus grand nombre et augmente le risque d'infection virale.

On effectue actuellement des recherches plus poussées pour déterminer si la pollution est en cause; la plupart de ces recherches sont menées ou subventionnées par les gouvernements ontarien et canadien.

Bien qu'une infection virale ou bactérienne rende le poisson moins appétissant, il ne semble pas que la consommation de poisson infecté présente un quelconque risque pour la santé humaine. Nous recommandons toutefois d'user de prudence.

Contaminants

De nombreuses substances, telles que le mercure, se trouvent naturellement dans l'air, l'eau et les aliments; à des concentrations normales, elles ne posent aucun risque pour l'environnement ou la santé humaine. Des substances synthétiques, comme les BPC, le mirex et les dioxines, sont également présentes dans le milieu.

Lorsqu'elles atteignent des concentrations supérieures aux seuils fixés par le gouvernement, on peut les qualifier de contaminants ou de polluants.

Sont décrites dans cette section une variété de substances qu'il est possible d'analyser dans le poisson gibier de l'Ontario.

Pour de plus amples renseignements sur ces substances et leur effet sur la santé, communiquer avec les responsables du Programme de surveillance de la contamination du poisson gibier. (voir à la page 1).

Substances inorganiques

Mercure

Le mercure est un métal naturel qui se rencontre à de faibles concentrations dans l'air, l'eau, les roches et le sol ainsi que dans les matières animales et végétales.

Il était naguère très utilisé dans l'industrie. Mais les mesures prises par cette dernière et le gouvernement à la fin des années 60 et au début des années 70 ont permis d'éliminer à toutes fins utiles les rejets de mercure par les principales sources industrielles.

Le mercure se fixe aux particules en suspension dans l'eau et se dépose au fond, où il est converti en méthylmercure par des micro-organismes. Ce composé est rapidement absorbé par les poissons, soit directement avec l'eau qui traverse leur membrane branchiale ou indirectement par les organismes dont ils s'alimentent. Comme les poissons éliminent le mercure très lentement, celui-ci s'accumule graduellement pour atteindre une concentration toujours plus grande.

Les directives pour la consommation à l'intention des pêcheurs de l'Ontario sont fondées sur les indications du gouvernement fédéral, les recommandations de l'Organisation mondiale de la santé et l'expérience médicale tirée de l'étude des épidémies d'intoxication par le méthylmercure survenues au Japon et en Iraq.

Autres métaux

On trouve parfois du cuivre, du nickel, du zinc, du cadmium, du manganèse, du chrome, de l'arsenic et du sélénium dans les tissus de poissons, mais à des concentrations telles qu'il ne s'avère pas nécessaire d'imposer des restrictions à la consommation.

En 1983, on a relevé de fortes concentrations de plomb dans des poissons pris en aval d'une usine de fabrication de plomb tétraéthyle sur le fleuve Saint-Laurent.

Or, depuis la fermeture de cette usine en 1985, la teneur en plomb a chuté.

Produits chimiques organiques de sources industrielles

Biphényles polychlorés (BPC)

Les BPC sont un groupe de composés organochlorés dont l'usage commercial remonte à la fin des années 20. Comme ils ne se trouvent pas dans la nature, leur présence est invariablement associée à l'activité humaine.

Les BPC ont tendance à persister dans l'environnement pendant des années et s'accumulent dans l'écosystème aquatique. Ainsi, dans certains cours d'eau de l'Ontario, des gros carnivores à tissus particulièrement adipeux, tels le saumon et la truite, ont stocké des BPC à des concentrations suffisantes pour avoir chez eux un effet contaminant.

Il est maintenant interdit d'utiliser des BPC dans la fabrication de nouveaux produits. Aujourd'hui, on les trouve uniquement dans le fluide isolant de transformateurs et condensateurs mis hors service.

L'imposition de règles rigoureuses pour l'entreposage et l'élimination des BPC et de l'équipement contaminé par des BPC a permis de limiter le rejet de ces composés dans la

nature et a contribué à en réduire la quantité dans le milieu aquatique. Les recommandations pour la consommation du poisson contaminé par les BPC se fondent sur le seuil de 2 parties par million établi par le gouvernement fédéral pour les poissons destinés à la vente.

Mirex

Le mirex est un hydrocarbure chloré utilisé comme pesticide dans le sud des États-Unis, mais qui n'a jamais été enregistré à cette fin au Canada.

La présence de mirex a surtout été décelée dans des poissons du lac Ontario. Les sources : une ancienne usine de transformation de mirex de Niagara Falls (New York) et une usine d'Oswego (New York). Dans le milieu aquatique, le mirex se comporte comme les BPC : il persiste longtemps dans l'environnement et se concentre dans les tissus adipeux. Le présent guide suit les recommandations fédérales en ce qui concerne la consommation de poisson contenant du mirex. Le seuil établi est de 0,1 partie par million pour le poisson destiné à la vente.

Pesticides

DDT

Le DDT a été mis au point pendant la Deuxième Guerre mondiale. Son emploi s'est largement répandu par la suite comme insecticide à des fins agricoles et sanitaires. Le DDT, comme les BPC et le mirex, se décompose lentement dans le milieu naturel.

Cette substance se trouve à des concentrations beaucoup moindres dans la chair des poissons depuis que son emploi a été réglementé. Les concentrations actuelles ne donnent lieu à aucune restriction pour la consommation.

Toxaphène

Le toxaphène est un insecticide extrêmement persistant dans le milieu aquatique. Il est interdit au Canada depuis 1974 et restreint aux États-Unis depuis 1982.

Il a été observé à l'occasion dans la chair de poissons de l'Ontario, mais à des concentrations trop faibles pour être dangereuses.

Autres pesticides

Dans le cadre du Programme de surveillance de la contamination du poisson gibier, plusieurs pesticides largement utilisés en Amérique du Nord sont analysés régulièrement. Il s'agit de l'hexachlorobenzène (HCB) et de pesticides tels le lindane, l'heptachlore, l'aldrine et le chlordane.

La concentration relevée aux stations d'échantillonnage de l'Ontario n'atteint pas un niveau tel qu'il faille restreindre la consommation du poisson.

Dioxines et furannes

Le ministère de l'Environnement et de l'Énergie a mis au point des méthodes d'analyse permettant de mesurer de très faibles concentrations de substances appartenant à la famille des dioxines et des furannes. Les conseils contenus dans le présent guide sont fondés sur la nouvelle directive concernant la consommation du poisson gibier en Ontario, élaborée selon les critères de Santé et Bien-être social Canada. Le ministère de l'Environnement et de l'Énergie surveille la présence dans le poisson gibier de 17 formes de dioxines et de furannes toxiques. Les concentrations décelées dans les poissons sont ensuite multipliées par des facteurs d'équivalence toxique afin d'obtenir une valeur qui représente la toxicité totale du poisson relativement à la forme de dioxine la plus toxique, soit la 2,3,7,8 TCDD. La nouvelle directive est l'équivalent toxique de 15 parties par billion de 2,3,7,8 TCDD. L'ancienne directive provinciale était de 20 parties par billion, mais ne tenait compte que de la 2,3,7,8 TCDD. Avec l'entrée en vigueur de cette nouvelle directive plus rigoureuse et des analyses plus poussées, les conseils sur la consommation du poisson de certaines parties des Grands Lacs ont été modifiés.

Substances nouvelles

Le Programme de surveillance de la contamination du poisson gibier vise à contrôler le plus grand nombre de substances possible. Dès que des méthodes permettant de déceler

surveillés dans le cadre du Programme : chlorophénols, chlorobenzènes et hydrocarbures aromatiques polycycliques (HAP). À l'heure actuelle cependant ces substances n'ont été décelées qu'occasionnellement dans les poissons et à des concentrations trop faibles pour susciter des inquiétudes.

Évolution des concentrations de polluants

La persistance des polluants dans le milieu aquatique varie d'une substance à l'autre. Leur décomposition ou transformation en substances inactives ou moins toxiques peut prendre de quelques minutes à quelques années. Ainsi, dans le cas des substances plus persistantes, comme les BPC, le DDT et le mirex, il faut recueillir et analyser des données pendant des années avant de parvenir à dégager des tendances sur leur évolution. Les données rassemblées grâce au Programme de surveillance de la contamination du poisson gibier sont particulièrement utiles pour déterminer l'augmentation ou la diminution des concentrations de polluants avec le temps.

Une des tendances les plus observées dans le cadre du Programme est la baisse graduelle d'un polluant chez les poissons quand la source de pollution a été contrôlée ou éliminée grâce à une intervention du gouvernement. Les BPC, le DDT et le mercure ont notamment fait l'objet d'une telle baisse.

Partout en Ontario on a décelé la présence de mercure dans la chair des poissons. Ce contaminant fait l'objet de plus de restrictions quant à la consommation du poisson gibier que toute autre substance surveillée dans le cadre du Programme.

Les grandes sources industrielles de mercure, c'est-à-dire les usines de chlore et de soude caustique et les usines de pâtes et papiers, ont été à toutes fins pratiques éliminées au début des années 1970. On retrouve cependant encore des traces de mercure dans le matériel électrique et scientifique, ainsi que dans les fongicides

utilisés sur les terrains de golf. Les produits de combustion des combustibles fossiles, qui retombent éventuellement au sol, contribuent également à contaminer les milieux aquatiques par le mercure.

À la fin des années 1960 et au début des années 1970, plusieurs plans d'eau de l'Ontario étaient contaminés par du mercure de source industrielle. À l'époque, les poissons prélevés dans ces plans d'eau présentaient une très forte teneur en mercure. Depuis que le gouvernement a adopté des mesures interdisant le rejet de mercure dans l'environnement, la concentration de mercure dans la chair des poissons a diminué. En 1970, les effluents d'une usine de chlore et de soude caustique de Sarnia rejetés dans la rivière Sainte-Claire ont contaminé les poissons du lac Sainte-Claire situé en aval. Les activités de pêche commerciale ont dû être interrompues à la suite de cet incident et on conseillait aux pêcheurs à la ligne d'éviter de consommer leurs prises. Le gouvernement provincial a rapidement imposé des mesures correctrices. Depuis lors, le poisson gibier du lac Sainte-Claire fait l'objet d'une surveillance annuelle pour différents contaminants. Le mercure est le seul contaminant pour lequel il existe des restrictions de consommation du poisson gibier. Toutefois, les concentrations de mercure dans la chair des poissons ont tellement décliné depuis qu'il n'est pas nécessaire dans la plupart des cas d'imposer des restrictions de consommation. La figure 1 montre la concentration annuelle moyenne de mercure décelée dans la chair des dorés prélevés dans le lac Sainte-Claire, de 1970 à 1991.

On a noté une baisse semblable de la concentration de mercure dans la chair des poissons prélevés dans le réseau hydrographique English-Wabigoon, en aval de l'usine de chlore et de soude caustique de Dryden. La concentration de mercure dans la chair des dorés a chuté considérablement après l'adoption des mesures de contrôle, soit de 1970 au début des années 1980. Il semble que la teneur en mercure de la chair des poissons ait atteint un plateau. La figure 2

montre la concentration annuelle de mercure dans la chair des dorés prélevés dans le lac Clay, le lac le plus rapproché de la source industrielle de mercure notée plus haut.

Plusieurs facteurs peuvent influencer sur la concentration de mercure décelée dans la chair des poissons. Les poissons exposés au mercure pendant une période prolongée ont tendance à en présenter des teneurs plus élevées, c'est donc le cas des vieux poissons et des poissons de grande taille. Les figures 3 et 4 montrent clairement que la concentration de mercure est proportionnelle à la longueur du poisson.

La concentration de mercure dans la chair des poissons dépend aussi du degré de contamination de la nourriture de ces derniers. Par exemple, les ménés et les autres petits poissons contiennent plus de mercure que les insectes et les invertébrés aquatiques. Aussi, les gros poissons carnivores comme le doré et le brochet ont tendance à être plus contaminés par le mercure que le corégone par exemple, ou d'autres espèces de poissons qui se nourrissent d'organismes à des maillons inférieurs de la chaîne alimentaire. (Voir la figure 3).

La concentration de mercure dans la chair de poissons de la même espèce et de la même taille varie grandement d'un plan d'eau à l'autre. La figure 4 montre la variation du taux de contamination par le mercure de dorés prélevés dans trois plans d'eau naturels en Ontario, c'est-à-dire des plans d'eau dans lesquels aucun effluent industriel n'a été rejeté. Cette variation est attribuable aux caractéristiques physiques, chimiques et biologiques propres à chaque plan d'eau.

En plus de son Programme de surveillance de la contamination du poisson gibier, le ministère de l'Environnement et de l'Énergie a mis sur pied le Programme des jeunes poissons de l'année qui permet de déceler de façon plus ponctuelle la présence de polluants et de donner des indications à court terme sur les tendances de contamination du poisson gibier. Dans le cadre du programme, on analyse la chair de ménés à queue à taches noires, de ménés à nageoires rouges et de jeunes perchaudes, qui ont

tendance à être plus sédentaires que les espèces de poisson gibier. On a pu, grâce à ce programme, déterminer certaines tendances de pollution en exerçant une surveillance à long terme d'un grand nombre d'endroits dans les Grands Lacs.
